

How to Write Academic Papers in Finance— Module 3

Bingfeng CEN

SoF, SHUFE

Overview

Module 3: Writing the Body, Conclusion and Bibliography

- ▶ Abstract
- ▶ Exercises
- ▶ Introduction
- ▶ Literature Review

Where Are We in the Paper?

A research paper usually contains:

1. Abstract
2. Introduction
3. Literature Review
4. **Body**
5. **Conclusion**
6. **Bibliography / References**

Learning Objectives

By the end of this module, you should be able to:

- ▶ Understand the standard structure of the main body
- ▶ Explain empirical strategy clearly
- ▶ Write results without simply reading tables
- ▶ Present tables, figures, and equations properly
- ▶ Write a meaningful conclusion
- ▶ Format and use references responsibly

Part 1 – Writing the Body

Writing the Body

The body answers one central question:

Why should the reader believe your answer?

We Focus on three types of Finance papers:

- ▶ Theoretical Paper
 - ▶ The mechanism follows logically from assumptions
- ▶ Empirical Paper
 - ▶ The results are supported by credible data and identification
- ▶ Experimental Paper
 - ▶ The treatment causes the observed outcome

Theoretical Paper Body Structure

1. Motivation and Economic Setting
2. Model Assumptions
3. Agents, Timing, and Payoffs
4. Equilibrium / Solution Concept
5. Main Propositions
6. Economic Intuition
7. Predictions / Implications

The Role of a Model

- ▶ A theoretical paper offers a structured explanation of a economic mechanism/phenomenon of interest.
- ▶ The model is a tool, not a reality.
 - ▶ Include the essential elements of the target problem
 - ▶ Abstract away from unnecessary details
 - ▶ Clarify a mechanism
 - ▶ Generate results or predictions

Question: What is the minimum set of ingredients needed to explain investor overtrading?

Model Setup

A theory model should clearly define:

- ▶ Who are the agents?
- ▶ What information do they have?
- ▶ What choices do they make?
 - ▶ What are their objectives?
- ▶ What is the timing?
- ▶ What is the equilibrium concept?

Assumptions: Order and Grouping

When writing assumptions:

- ▶ Start with natural assumptions
- ▶ Move to stronger or more restrictive assumptions
- ▶ Group assumptions by category
- ▶ Use meaningful names, not only numbers

Example categories:

- ▶ Investor preferences
- ▶ Information structure
- ▶ Asset payoff process
- ▶ Market constraints

A1: The investor is overconfident.

A2: The return is normally distributed.

A3: The investor has CARA utility.

A4: Trading is costly.

A5: The investor observes a signal.

Preferences: The investor has CARA utility and may receive psychological utility from trading.

Information: The investor observes a noisy signal about future returns.

Asset returns: Risky asset returns are normally distributed.

Market friction: Trading involves a proportional transaction cost.

Notations

Good notation should be easy to guess.

- ▶ Use meaningful symbols
- ▶ Define **every** variable
- ▶ Use consistent notation
- ▶ Avoid notation used only once
 - ▶ “Let Ω denote the set of all possible psychological states.” But you never use Ω again.
 - ▶ “Investors may differ in their psychological benefit from trading.”
- ▶ Avoid too many subscripts and superscripts if feasible

Example:

$$c_t = f(W_t)$$

where c_t is consumption and W_t is wealth.

Definitions Need Examples

For a central property, show:

1. An object that satisfies it
2. An object that does not satisfy it
3. A borderline case

Example:

An investor is “attention constrained” if she can process at most one signal per period.

1. Investor observes only earnings news.
2. Investor processes all firm, industry, and macro signals.
3. Investor can process two signals but ignores macro news.

Theorems and Propositions

Formal results should be:

- ▶ Stated in simple English
- ▶ Written in parallel format
- ▶ Clearly linked to assumptions
- ▶ Followed by economic intuition
- ▶ Testable implications

Proof or proof sketch is need:

- ▶ Step 1, Step 2, Claim 1, Claim 2, Case 1/Case 2
 - ▶ Step 1: Show the objective function is concave.
 - ▶ Step 2: Derive the first-order condition.
 - ▶ Step 3: Compare the optimal trading level with the benchmark case.
- ▶ Math to English in Proof: 52% - 63.5%

Proposition Template

A good theory result explains:

- ▶ What the proposition says
- ▶ When it holds
- ▶ Why it holds
- ▶ What it implies

Template:

“Proposition 1 shows that when [condition], [result]. The intuition is that [mechanism]. This implies that we should observe [prediction].”

Example:

Proposition 1 shows that investors are less willing to realize losses when leverage is available. The intuition is that leverage allows investors to maintain risky positions beyond their mental budget, increasing reluctance to close losing positions. This implies that leverage may strengthen the disposition effect.

Empirical Paper Body Structure

1. Institutional Background / Setting
2. Data and Sample
3. Empirical Strategy
4. Main Results
5. Mechanism / Additional Tests
6. Robustness Checks

How do we know the estimated effect is credible?

Institutional Background: Not a Textbook

- ▶ What is the relevant setting?
- ▶ What institutional feature creates useful variation?
- ▶ Why is this setting suitable for the research question?
- ▶ What does the reader need to know before seeing the empirical design?

Example 1:

China's stock market has developed rapidly since the 1990s.

The staggered introduction of margin trading across eligible stocks creates variation in financing constraints and trading opportunities, allowing us to examine how access to margin trading affects stock liquidity.

Example 2:

China's capital market is important and has developed rapidly in recent years. Many reforms have affected listed firms.

The reform was implemented in stages across firms, creating variation in treatment timing. This institutional feature allows us to compare affected and unaffected firms before and after the reform.

Data and Sample Construction

- ▶ Data source
- ▶ Sample period
- ▶ Unit of observation
- ▶ Sample restrictions
- ▶ Variable construction
- ▶ Final sample size

Example 1:

Our sample consists of firm-year observations for Chinese A-share listed firms from 2010 to 2022.”

Example 2:

We use CSMAR data.

We obtain accounting variables from CSMAR, stock return data from RESSET, and M&A transaction data from Wind. We exclude financial firms, ST firms, and observations with missing key variables.”

Empirical Results

Do not just report significance.

A good empirical result explains:

- ▶ Direction
- ▶ Magnitude
- ▶ Statistical significance
- ▶ Economic meaning
- ▶ Link to hypothesis

Example 1:

Table 2 shows significant results. It is consistent with hypothesis 1.

Example 2:

The results, presented in Table X, show that OverseaExperience is positively and significantly associated with the likelihood of cross-border M&A across all models, suggesting that firms with internationally experienced executives are significantly more likely to pursue foreign acquisitions. This finding strongly supports the hypothesis that such executives play a critical role in driving cross-border M&A activity.

Experimental Paper Body Structure

1. Research Question and Hypotheses
2. Experimental Design
3. Treatment and Control Conditions
4. Randomization and Balance
5. Outcome Measures
6. Main Treatment Effects
7. Mechanisms / Heterogeneity
8. **External Validity and Limitations**

Experimental Paper: Design Details

A good experiment section should explain:

- ▶ Who are the participants?
- ▶ What is randomly assigned?
- ▶ What does the treatment change?
- ▶ What does the control group receive?
- ▶ What outcomes are measured?
- ▶ When are outcomes measured?

Design an experiment

Many young investors misunderstand investment risk. You want to test whether presenting risk information visually improves their portfolio choices. In particular, you compare a standard text warning with a visual risk chart.

Experimental Paper: Validity Concerns

Experiment papers must address:

- ▶ Internal validity
 - ▶ Was assignment random?
 - ▶ Are groups balanced?
 - ▶ Did participants comply?
- ▶ External validity
 - ▶ Does the result generalize?
 - ▶ Is the setting realistic?
- ▶ Mechanism
 - ▶ Why did the treatment work?

Experiment Results

A good experiment result explains:

- ▶ Treatment effect
- ▶ Control group benchmark
- ▶ Statistical significance
- ▶ Magnitude Mechanism or heterogeneity

Example 1:

The treatment group behaves differently.

Example 2:

Participants receiving financial literacy information are 15 percentage points more likely to choose diversified portfolios than those in the control group.

Variable Definitions

For each key variable, define:

- ▶ What it measures
- ▶ How it is constructed
- ▶ Whether it is continuous, binary, or categorical
- ▶ Expected direction
- ▶ Data source

Key variables:

- ▶ Dependent variable
- ▶ Main explanatory variable
- ▶ Control variables
- ▶ Fixed effects

Example:

We use Size, ROA, Leverage, and Cash as controls.

Firm size is measured as the natural logarithm of total assets. ROA is net income divided by total assets. Leverage is total liabilities divided by total assets. Cash is cash and cash equivalents scaled by total assets.

Appendix

Variable Definitions

The table provides a description of the variables reported in the tables and figures. A detailed description of the internal SLI data and how we translate them into databases is provided in the [Internet Appendix](#).

Variable	Description	Source
<i>FM Meeting</i>	Indicates an FM meeting with a portfolio firm taking place on day t .	SLI
<i>GS Meeting</i>	Indicates a GS meeting with a portfolio firm taking place	SLI
Variable	Description	Source
<i>FM</i> _{0,5} , <i>FM</i> _{6,20}	Indicator variables set to one if an FM meeting takes place within a [0, 5] and [6, 20] trading-day window, respectively	SLI
<i>GS</i> _{0,5} , <i>GS</i> _{6,20}	Indicator variables set to one if a GS meeting takes place within a [0, 5] and [6, 20] trading-day window, respectively	SLI
<i>Active health warning</i>	Indicates a portfolio firm being on the internal governance health warning list on day t .	SLI
<i>FM attendees</i>	Indicates the number of FMs attending an FM meeting.	SLI
<i>Portfolio firm attendees</i>	Indicates the number of portfolio firm attendees in an FM meeting.	SLI
<i>Portfolio firm CEO</i>	Indicates an FM meeting attended by the CEO of the portfolio firm.	SLI
<i>Portfolio firm CFO</i>	Indicates an FM meeting attended by the CFO of the	SLI

Summary Statistics

Summary statistics help readers understand:

- ▶ Sample characteristics
- ▶ Variable scale
- ▶ Distribution
- ▶ Outliers
- ▶ Whether values are reasonable

A basic summary table includes:

- ▶ Mean
- ▶ Standard deviation
- ▶ Median
- ▶ Minimum
- ▶ Maximum
- ▶ Number of observations

Table I
Characteristics of Private Meetings with Portfolio Firms

This table reports summary statistics for fund manager (FM) and governance specialist (GS) meetings with portfolio firms' directors and executives in Panels A and B, respectively. All variables and data sources are described in the [Appendix](#) and summarized here. *Active health warning* indicates whether a governance health warning is active; *FM attendees* indicates the number of FMs attending; *Portfolio firm attendees* indicates the number of portfolio firm representatives attending; *Portfolio firm CEO/CFO/Chair* is a dummy variable set to one if any one of these roles attend; *PF CEO+* indicates that at least two among CEO/CFO/Chair attend; *MCap \$ firm* measures the US\$ market capitalization of the portfolio firm on the meeting day in millions; and *Avg. agg. stake held* measures the asset manager's stake held as a fraction of shares outstanding, aggregated across all funds, on the meeting day.

Panel A: FM Meetings with Portfolio Firms

Variable	Mean	Median	Min	Max	<i>SD</i>	Obs
<i>FM Meeting</i>	1.00	1.00	1.00	1.00	0.00	3,410
<i>Active health warning</i>	0.13	0.00	0.00	1.00	0.34	3,410
<i>FM attendees</i>	3.70	3.00	1.00	15.00	2.94	3,119
<i>Portfolio firm attendees</i>	1.84	2.00	0.00	6.00	0.91	3,030
<i>Portfolio firm CEO</i>	0.50	0.50	0.00	1.00	0.50	3,410
<i>Portfolio firm CFO</i>	0.51	1.00	0.00	1.00	0.50	3,410
<i>Portfolio firm Chair</i>	0.03	0.00	0.00	1.00	0.17	3,410
<i>PF CEO+</i>	0.65	1.00	0.00	1.00	0.48	3,410
<i>MCap \$ firm, million</i>	7737	1,547	40	137,057	16,292	3,410
<i>Avg. agg. stake held</i>	0.04	0.02	0.00	0.20	0.04	3,410

Empirical Strategy

A regression equation is not an identification strategy!

- ▶ What variation identifies the effect
- ▶ What comparison is being made
- ▶ What assumptions are required
- ▶ What threats remain

Examples:

- ▶ OLS: what are controlled for
- ▶ IV: relevance and exclusion conditions
- ▶ DiD: parallel trend
- ▶ Event Study: watch for confounding events
- ▶ RDD: cutoff windows

Equations

- ▶ Present only necessary equations
- ▶ Define all variables
- ▶ Explain the coefficient or object of interest
- ▶ Connect math to economic meaning

$$Pr(IntM\&A_{i,t}) = \alpha_0 + \alpha_1 OverseaExperience_{i,t} + \alpha_2 Controls_{i,t} + Industry_{it} + Year_{it} + \varepsilon$$

$$RelativePrice_i = \alpha_0 + \alpha_1 InstituionNum_i + \Sigma \beta_i Controls_i + \delta$$

$$Return_{i,t} = \beta GenAI Reliance_{i,t-1} + \gamma Control_{i,t-1} + \alpha_t + \varepsilon_{i,t}$$

$$Tone_{i,t} = \alpha + \beta Pledge_{i,t} + \gamma Control_{i,t-1} + year_t + industry + \varepsilon_{i,t}$$

Writing Results

- ▶ Start with the main economic message
- ▶ Refer to the table or figure
- ▶ Explain the magnitude
- ▶ Interpret the result
- ▶ Connect back to the hypothesis

Figures

Rule: One figure = One story

- ▶ Have a clear message
 - ▶ Show trend
 - ▶ Show change
 - ▶ Show mechanism
 - ▶ ...
- ▶ Be easy to read
- ▶ Use informative labels
- ▶ Be discussed in the text

Figure 1. Dynamic Effect of AI-Powered Governance on Firm Valuation

The figure plots the estimated coefficients and their associated two-tailed 95% confidence intervals from a yearly event-time specification, where the horizontal axis indicates years relative to the GPT shock in 2022. Panel A reports results for Tobin's Q, defined as the ratio of the market value of assets to the book value of assets. Panel B presents results for Total Q, which extends Tobin's Q by incorporating intangible capital following Peters and Taylor (2017). Both measures are constructed as yearly averages.

Tables

- ▶ Use clear titles
 - ▶ Table 3. Results
 - ▶ Table 3. Effect of Financial Literacy Training on Portfolio Diversification
- ▶ Label variables and units
- ▶ Explain the key result in the text
- ▶ Avoid unnecessary columns
- ▶ Add notes for standard errors, controls, fixed effects, and sample

Table 3. GenAI Reliance and Hedge Fund Performance: DiD

This table reports the relation between performance and reliance on generative AI information. *Return* is the portfolio holdings return. *GenAI Reliance* is defined in equation (3), which quantifies the degree to which changes in portfolio holdings are influenced by fundamental information generated by ChatGPT. *Post GPT* is an indicator variable equal to one for performance in the third quarter of 2022 and onwards, and zero otherwise. *CAPM Alpha* (*FF3 Alpha*/*FF4 Alpha*) is the portfolio holdings return, after adjusting for the market risk factor (Fama-French three factors/Fama-French-Carhart four factors). *Size* is the natural logarithm of total holdings value. *Age* is the number of years since a hedge fund company's first 13F report. *Turnover* is the minimum of purchases and sales scaled by total holdings value. *Risk* is the standard deviation of quarterly portfolio returns in the past two years. *Past Return* is the lagged *Return*. The sample period is from the first quarter of 2016 to the third quarter of 2024. The *t*-statistics, in parentheses, are based on standard errors clustered by fund. * $p < .1$; ** $p < .05$; *** $p < .01$.

Panel A: Raw return

Mechanism Tests

Mechanism tests answer: Why does this effect occur?

- ▶ Proposed channel
- ▶ Testable implication
- ▶ Empirical test
- ▶ Interpretation
- ▶ E.g., financing constraints, information asymmetry, bargaining power, monitoring, investor attention...

Exercise:

- ▶ Research question: Does analyst coverage affect stock liquidity?
- ▶ Possible mechanism: Analyst coverage reduces information asymmetry.
- ▶ Testable implication:
- ▶ Writing

Heterogeneity vs Mechanism

- ▶ Heterogeneity asks:
- ▶ **For whom is the effect stronger?**
- ▶ Mechanism asks:
- ▶ **Why does the effect occur?**
- ▶ Heterogeneity can support mechanism only when it is linked to theory.

Robustness Checks

Does the result survive alternative choices?

- ▶ Alternative variable definitions
- ▶ Alternative samples
- ▶ Additional controls
- ▶ Placebo tests
- ▶ Pre-trend tests
- ▶ Alternative estimation methods

Example:

To address the concern that our findings depend on the measure of risk-taking, we replace the risky asset share with the probability of holding any risky asset. The coefficient remains positive and statistically significant.

A good robustness section is organized by concerns, not by tables.

Exercise: Mechanism or Heterogeneity

Classify each statement as mechanism, heterogeneity, or neither.

1. The effect is stronger for firms with high information asymmetry.
2. The coefficient remains significant after adding controls.
3. The effect is stronger for firms with limited analyst coverage, consistent with an information channel.
4. The result holds after excluding financial firms.

Part 2 – Writing the Conclusion and Organizing the Bibliography

Conclusion Structure

Your last chance to shape what readers remember.

(Typically about one page)

- ▶ Restate the research question briefly
- ▶ Highlight the main finding
- ▶ Explain why the finding matters
- ▶ Suggest **broader** implications
- ▶ End with a clear final message

- ▶ Abstract: What is this paper about?
- ▶ Introduction: Why should we care?
- ▶ Body: How do we know the answer?
- ▶ Conclusion: What should we remember?
- ▶ Bibliography: Who are we building on?

Conclusion by Paper Type

Empirical:	Main finding, credibility, economic implication
Theoretical:	Mechanism, new prediction, conceptual contribution
Experimental:	Treatment effect, causal interpretation, external validity

Bibliography

- ▶ Which academic conversation you enter
- ▶ Which ideas you build on
- ▶ Which methods you follow
- ▶ Where your evidence comes from
- ▶ Your academic credibility
- ❖ Empirical: Data sources, identification methods, related empirical findings
- ❖ Theory: Foundational models, assumptions, solution concepts
- ❖ Experiment: Design papers, treatment literature, behavioral mechanisms

Citation Style and Integrity

- ▶ Cite papers you actually read
- ▶ Cite ideas, not just names
- ▶ Keep in-text citations and bibliography consistent
- ▶ Use a consistent format
- ▶ Verify all references

Warning:

- ▶ **AI may generate fake references!**

Example Reference Format

In text:

- ▶ “Fama and French (1992) show that size and book-to-market explain cross-sectional stock returns.”

Reference list:

- ▶ Fama, Eugene F., and Kenneth R. French, 1992, The cross-section of expected stock returns, *Journal of Finance* 47, 427–465.

Reference Format

- ▶ Order references alphabetically by the first author's last name.
- ▶ If the same author has multiple papers, order them by year.
- ▶ If the same author has multiple papers in the same year, use 2020a, 2020b.
- ▶ Make sure every in-text citation appears in the reference list.
- ▶ Make sure every reference in the list is cited in the text.
- ▶ Use one citation style consistently. (Don't mix APA, MLA, Chicago citation styles)
